Comment: 01
Individuals consuming large quantities of predatory fish, e.g., pike in freshwater, tuna and swordfish in saltwater, may have blood levels of methylmercury as high as 200 ug/L, posing a significant health risk. Unlike inorganic mercury the major excretory route for MeHg (about 90%) is through the bile. To help differentiate between MeHg and inorganic mercury exposure, evaluate both blood and urine mercury levels. An elevated urine mercury is most consistent with inorganic mercury exposure unless patient history dictates otherwise.
